ESCAFCA
Eastern Sandoval County Arroyo
Flood Control Authority

WILSON
& COMPANY

1 Introduction

The *Drainage Master Plan and Needs Assessment* prepared for the Eastern Sandoval County Arroyo Flood Control Authority (ESCAFCA) by Wilson & Company in 2008 identified several drainage issues within the Town of Bernalillo. This report analyzes an area in South Bernalillo Watershed identified in the mentioned report as the problem area with reported flooding problems.

1.1 Authority

The Eastern Sandoval County Arroyo Flood Control Authority (ESCAFCA) is a political subdivision of the State of New Mexico. ESCAFCA's purpose is to acquire, equip, maintain, and operate a flood control system for the benefit of the residents of Eastern Sandoval County. ESCAFCA has authorized Wilson & Company to conduct this feasibility study on its behalf.

1.2 Purpose

The purpose of this report is to present a feasible underground storm drain system and temporary retention Alternative for the area in the South Bernalillo watershed that would mitigate flooding impacts to private property, public roadways, and ditches maintained by the Middle Rio Grande Conservancy District due to flows originating from the I-25 right-of-way and large basins upstream of I-25. Based on available mapping, analysis, and anecdotal information, it is the runoff from these large basins that cause the majority of the flooding problems in the South Bernalillo area. This report provides a conceptual analysis of retention and conveyance system and includes concept level cost estimates. This report is intended to serve as an aid to the ESCAFCA board in prioritizing the steps needed to mitigate flooding problems in the area.

1.3 Goals and Objectives

The goals and objectives of this report are to:

- a. Evaluate existing drainage patterns and flooding potential within the study area
- b. Recommend most suitable retention and conveyance system for the project site

2 Existing Conditions

Drainage problems in South Bernalillo Watershed like most of the areas in the ESCAFCA jurisdiction are due largely to the lack of adequate stormwater conveyance capacity between I-25 and the Rio Grande. Thus, large rainfall events have historically resulted in stormwater damage to private businesses, residences and public roadways.

2.1 Watershed Description

The project area is located in the South Bernalillo Watershed and majority of it is developed with residential properties. The area is flat and slopes in northeasterly to southwesterly direction. The area is bounded by South Hill Road and Bernalillo Acequia to the east, BNSF railway to the west, NM 550 to the north and Richardson Drive to the south. The project site was identified as problem area per Drainage Master Plan and

Needs Assessment prepared by Wilson & Company Inc. Figure 1 is a location map for the study area.

Figure 1 – Location Map

2.2 Existing Drainage Patterns

The South Bernalillo Watershed historically discharged to the Rio Grande. The watershed is south of NM 550. Majority of drainage problems in South Bernalillo watershed south of NM 550 occur between the BNSF railway and I-25. Runoffs upstream of I-25 are conveyed through existing culverts and sheet flow in a southwesterly direction to South Hill Road and pond against the Bernalillo Acequia embankment.

The MRGCD maintains an extensive network of acequias, canals, laterals, and drains within the ESCAFCA jurisdiction. Bernalillo Acequia is located downstream of South Hill

Road and conveys some flows south but during large storm event runoff overtops the Acequia and causing damage to adjacent private properties.

Due to flat grades and lack of conveyance system, accumulated runoff pond in the area and cause flooding during major storm event. The overall flow path is to south and southwest with BNSF railway blocking the runoff sheet flowing west. The existing residential development west of South Hill Road block the natural drainage path from east of I-25 and are at risk of flooding in large storm events. In some areas the street grades are higher than the adjacent properties causing flooding. Flooding has caused less damage to the areas that include mobile homes due to their raised elevation.

No topographic mapping was performed for this study and Lidar mapping was used to determine existing drainage patterns. Lidar mapping used was provided by Bohannan Huston, Inc. for the Town of Bernalillo. Due to the flat grades a detailed topographic mapping is recommended prior to final design.

2.3 Geotechnical Study

Amec Earth and Environmental, Inc. performed a field study to determine depth of groundwater below the referenced site. Two borings were drilled at the site to a depth of approximately 20 feet below existing grade. The soil samples indicate that the site consists primarily of sandy clay (CL) overlaying relatively clean sand (SP, SP-SM). The sandy clay is of medium plasticity and is moderately firm to firm in consistency. The sand is fine grained directly below the clay, increasing in coarseness with depth, is non-plastic, very loose to medium sand and contains a trace of gravel to ½ inch.

Groundwater was encountered at a depth of 13.5 to 13.75 feet. The Study recommended a maximum excavation depth of 9 feet below existing grade and subgrade soils suitable for construction of dry wells. Dry wells are vertical holes in ground filled with rocks designed to remove surface water.

3 Hydrologic Analysis

A hydrologic analysis of the watershed was completed using the Arid Lands Hydrologic Model (AHYMO) software. AHYMO computes a hydrograph for each sub-basin based on its physical properties. These hydrographs are then routed along waterways and drainage paths to determine a peak discharge at points of interest throughout the watershed. The AHYMO simulation developed for the Drainage Master Plan and Needs Assessment was edited and utilized to determine peak discharges and runoff volumes for the basins discharging to the project area. The rainfall depth for the 100-yr storm event was modified in the AHYMO simulation to represent the average rainfall condition for the specific basins draining to the South Bernalillo area. The total rainfall depth was reduced from 3.42 inches to 2.71 inches based on NOAA Atlas 14 precipitation depths to more accurately represent the smaller region tributary to the project area. See Table 1 for Precipitation and Frequency Estimates and Appendix or 100 year storm AHYMO output file.

| STORM YEAR | 15 MIN | 60 MIN | 6 HR | 24 HR |
|-------------------|---------------|---------------|-------------|--------------|
| 1 | 0.33 | 0.54 | 0.79 | 1.01 |
| 2 | 0.42 | 0.70 | 0.99 | 1.27 |
| 5 | 0.56 | 0.94 | 1.27 | 1.58 |
| 10 | 0.67 | 1.12 | 1.49 | 1.84 |
| 100 | 1.06 | 1.77 | 2.28 | 2.71 |

4 Proposed Improvements

The Drainage Master Plan and Needs Assessment identified the project site as the problem area and recognized the need for detention facilities upstream of the project area to alleviate the need for large conveyance system. Until the construction of South Bernalillo Detention Facility is in place, an underground conveyance system and a temporary retention pond can alleviate the flooding issues in the area although not completely eliminating it. The intent of this study is to analyze a system for maximum collection of runoff in the area and retaining it until an outlet from the pond can be added for a permanent detention facility.

The modified AHYMO model developed for the Drainage Master Plan and Needs Assessment was utilized to determine peak discharges and runoff volumes contributing to the proposed retention pond. Basins 304 and 306 of South Bernalillo Basins were used to determine the peak flow and runoff volume for the project site. See Watershed Area exhibit in the Appendix and Table 2 for Basin Summary.

| DRAINAGE AREA (AC) | STORM YEAR | 100 | 10 | 5 | 2 |
|---------------------------|-------------------|------------|-----------|----------|----------|
| 63.9 | Q Peak (cfs) | 97.0 | 52.1 | 41.0 | 27.6 |
| | Volume (ac-ft) | 8.2 | 4.8 | 3.8 | 2.8 |
| 76.7* | Q Peak (cfs) | 114.8 | 61.6 | 48.4 | 32.6 |
| | Volume (ac-ft) | 9.9 | 5.7 | 4.6 | 3.3 |

* POSSIBLE WITH DEEPER POND

Table 3 is a detailed list of all the contributing sub-basins for different storm year event.

| * DEEPER POND | | | | | | | | | | |

A pond location is considered at the southeast corner of the intersection of Melissa Road and Athena Avenue. Majority of the proposed site is developed leaving no other location for any other sizable pond. There are several deciding factors in determining the quantity of runoff that can be conveyed into the pond. Direction of existing grades, runoff travel distance, location of the proposed pond and its proximity to existing residential development and high water table in the area which limits the pond depth are some of the major factors in determining the pond retention volume. Different Pond Alternatives are proposed in order to choose which Alternative will be the most feasible one for the community.

Four conveyance systems were analyzed to convey accumulated runoff into the pond. The four systems collect runoff of an area of approximately 64 acres between west of Bernalillo Acequia and east of Carolina drive. The Overall Conveyance Layout exhibit is included in Appendix shows the three conveyance alignments. Plan & profile for the alignments are included in Appendix. Hydraflow Storm Sewer was used to analyze each alignment and determine the required pipe sizes. See hydraulic calculations in Appendix.

The First and Second systems collect runoff from north and northeast of Melissa Road. The Third system collects runoff from north of Athena Avenue. If a deeper pond was allowed to increase the pond depth from 5 feet to 8 feet and lower the invert elevation of pond inlet an additional 3 feet, the runoff contributing area may be increased to approximately 77 acres. Then, this alignment could convey additional runoff from south half of Carolina Drive and Garcia Lane. See Table 2, Basin Summary for information.

The Fourth system conveys runoff accumulated east and southeast of Mountain View Drive. The discharge point of this alignment could not be located in the public right of way and must go through private properties and therefore a need to purchase an easement along the pipe line. The three conveyance systems analyzed in this study convey a total of 97 cfs for the 100-year storm. With possibility of a deeper pond and larger pipes, total conveyance capacity could increase to 115 cfs. See Hydraflow calculations for deep pond in the Appendix.

Different factors play a role in determining the extents of a conveyance system. Factors like flat grades, site sloping in a southwesterly direction and away from the pond, its location and high water table. These factors make it impossible to convey runoff accumulated downstream of the pond and reversing the natural flow direction back into it. These factors are evident in areas southwest of Athena Avenue. See Table 4 for conceptual level cost estimates for the underground storm sewer system. This cost estimate does not reflect possibility of deeper pond.

TABLE 4: Conceptual Cost Estimate for Underground Storm Sewer

| Item | Description | Unit | Unit Cost | Quantity | Total |
|------|---|------|-----------|------------------------|------------------|
| 1 | 24" RCP Pipe Class III, Incl. Trench, Backfill & Compaction, (0' to 10' depth), CIP | LF | \$80 | 1,461.00 | \$116,880 |
| 2 | 30" RCP Pipe Class III, Incl. Trench, Backfill & Compaction, (0' to 10' depth), CIP | LF | \$80 | 2,435.00 | \$194,800 |
| 3 | 36" RCP Pipe Class III, Incl. Trench, Backfill & Compaction, (0' to 10' depth), CIP | LF | \$80 | 150.00 | \$12,000 |
| 4 | Storm Sewer Fittings Incl. Type "C" Curb Inlets, 4' dia Manholes at depth of 0-6', Outfalls | LS | \$175,000 | 1.00 | \$175,000 |
| 5 | Underground Infiltration Galleries | LS | \$30,000 | 1.00 | \$30,000 |
| 6 | 20' wide Easement Acquisition for pipe alignment 4 | AC | \$20,000 | 0.15 | \$3,000 |
| 7 | Existing Asphalt Concrete Pavement Remove, Dispose & Replace | SY | \$15 | 3,850.00 | \$57,750 |
| | | | | Subtotal | \$531,680 |
| | | | | 30% Contingency | \$159,504 |
| | | | | Estimated Total | \$691,184 |

4.1 Pond Alternatives

Four Pond Alternatives were analyzed to provide a better understanding in selection of preferred Pond Alternative for the area which would alleviate the existing problems until a permanent solution is developed. Peak discharges from the basins contributing to the pond were added to determine the required capacity of each Pond Alternative. It is

intended to discharge runoff to the pond from Bobby Place and Bernalillo Acequia from the north to Garcia Lane from the south. All four Alternatives include a 10 foot wide drivable access and one foot of freeboard. Each alternative can accommodate a field sport activity with approximate area of 36,000 sq. ft and additional area which could be dedicated as playground area. See Table 5 for a summary of each Pond Alternative.

| TABLE 5: POND SUMMARY | | | | | | | |
|-----------------------|---------------------|---------------|------------------|------------|--------------------------|-------------------------|-------------|
| ALTERNATIVE | POND DATA | | | | AVAILABLE VOLUME (AC-FT) | | |
| | FREEBOARD ELEV (FT) | TOP ELEV (FT) | BOTTOM ELEV (FT) | SIDE SLOPE | TOTAL WITH FREEBOARD | TOTAL WITHOUT FREEBOARD | LOWER LEVEL |
| 1 | 5057.0 | 5056.0 | 5051.0 | 6:1 | 15.89 | 12.40 | N/A |
| 2 | 5057.0 | 5056.0 | 5051.0 | 10:1 | 13.99 | 10.59 | N/A |
| 3 | 5057.0 | 5056.0 | 5051.0 | 6:1 | 13.09 | 9.71 | 4.15 |
| 4 | 5055.0 | 5054.0 | 5051.0 | 6:1 | 8.06 | 5.47 | 3.31 |

Bottom of ponds are graded towards the deepest corner of the pond near the intersection of Athena Avenue and Melisa Road. This grading will provide positive drainage into one corner since there is no outlet from the pond and discourage shallow water Ponding. Also as a temporary solution to drain the pond, underground infiltration galleries will be installed at this location to collect the 1 year storm volume. Dry wells will be needed to drain the collected runoff. A more detailed study is needed prior to design of dry wells.

Different Pond Alternatives, without possibility of deeper pond, are presented in this report to provide full potential of each alternative. Exhibits for each retention alternative are included in the following sections of this report along with cost estimates for each Alternative. To be able to use the maximum retention volume, each Pond Alternative was analyzed using different storm year. See Table 6 for a pond capacity summary.

| TABLE 6: POND CAPACITY SUMMARY | | | | |
|--------------------------------|------------|-----|-----|-----|
| POND | STORM YEAR | | | |
| | 100 | 10 | 5 | 2 |
| 1 | YES | YES | YES | YES |
| 2 | YES | YES | YES | YES |
| 3 OVERALL | YES | YES | YES | YES |
| 3 LOWER | N/A | N/A | YES | YES |
| 4 OVERALL | N/A | YES | YES | YES |
| 4 LOWER | N/A | N/A | N/A | YES |

A summary of the pros and cons of each Pond Alternative, without possibility of deeper pond, is presented on the Alternatives analysis tables included in the Summary and Recommendations section.

4.1.1 Pond Alternative 1

Pond Alternative 1 has the capacity to contain 12.4 ac-ft with additional 1 ft of freeboard. The pond has a 6:1 side slope and will be 5 feet deep. See Exhibit 1, Pond Alternative 1. The top of pond elevation will be at 5056.00 and bottom elevation at 5051.00. The entire project site will provide retention volume for the accumulated runoff and can retain the 100-year storm. This Alternative will be a single level park and the site can be used for any park or play activity. A cost estimate for Pond Alternative 1 is included on Table 7.

| Item | Description | Unit | Unit Cost | Quantity | Total |
|------|---|------|-------------|------------------------|------------------|
| 1 | Pond excavation | CY | \$4.0 | 27,170 | \$108,680 |
| 2 | 10' Wide Access, 6" Gravel Base Course | SY | \$7.0 | 2,110 | \$14,770 |
| 3 | Perimeter Fence, Incl. Multiple entry Gates | LF | \$10.0 | 1,900 | \$19,000 |
| 4 | Furnish and install Play field, CIP. | LS | \$20,000.0 | 1 | \$20,000 |

4.1.2 Pond Alternative 2

Pond Alternative 2 has the capacity to contain 10.6 ac-ft with 1 ft of freeboard. This pond Alternative includes a 10:1 side slope and will be 5 feet deep. See Exhibit 2, Pond Alternative 2. This Alternative will be very similar to the Alternative 1 with the exception of shallower side slopes of 10:1 which will result in less retention volume. This Alternative can retain the 100-year storm and will be a single level park to serve as the local community park. A cost estimate for Pond Alternative 2 is included on Table 8.

4.1.3 Pond Alternative 3

Pond Alternative 3 has the overall capacity of 9.7 ac-ft with 1 ft of freeboard. This pond Alternative includes a 6:1 side slope and will have a total of 5 feet of depth. See Exhibit 3, Pond Alternative 3. This Alternative will be a multi level pond. The lower level portion of the pond is 3 feet deep and the upper portion has an additional 2 feet of depth. In smaller storm events only the lower level of pond will retain water and the higher level will remain dry. The lower level of the pond can contain a volume of 4.1 ac-ft. This Alternative can retain up to the 10-year storm. The lower level pond can retain only the 2-year storm. Since the upper level of the pond will remain drier than lower level, it would be better to allocate it for usages such as playground area. A cost estimate for Pond Alternative 3 is included on Table 9.

| Item | Description | Unit | Unit Cost | Quantity | Total |

4.1.4 Pond Alternative 4

Pond Alternative 4 has the overall capacity to contain 4.9 ac-ft with 1 ft of freeboard. This Pond Alternative includes a 6:1 side slope and will be 3 feet deep. See Exhibit 4, Pond Alternative 4. Similar to Alternative 3, it will also be a multi level pond. The lower level of the pond is 2 feet deep and the upper level has an additional 1 foot. In smaller storm events only the lower level of pond will retain water and the higher level will remain dry. The lower level of the pond can contain a volume of 3.3 ac-ft. This Alternative can retain up to the 5-year storm. The lower level pond can retain only the 2-year storm. An approximate area of 22,000 sq ft in the southwest corner of the pond which was not included in the pond volume calculations is graded higher than the freeboard elevation of the pond which is expected to remain dry and be fully usable at any time. A cost estimate for Pond Alternative 4 is included on Table 10.

| Item | Description | Unit | Unit Cost | Quantity | Total |
|-------------|---|-------------|------------------|------------------------|------------------|
| 1 | Pond excavation | CY | \$4.0 | 25,020 | \$100,080 |
| 2 | 10' Wide Access, 6" Gravel Base Course | SY | \$7.0 | 2,110 | \$14,770 |
| 3 | Perimeter Fence, Incl. Multiple entry Gates | LF | \$10.0 | 1,900 | \$19,000 |
| 4 | Furnish and install Play field, CIP. | LS | \$20,000.0 | 1 | \$20,000 |
| 5 | Sodded Turf, CIP | SY | \$8.5 | 4,000 | \$34,000 |
| 6 | Play Equipment, CIP | LS | \$70,000.0 | 1 | \$70,000 |
| 7 | Site Amenities Incl. Picnic tables, Benches, Trash Receptacles, Bicycle Rack, Shade Structure | LS | \$125,000.0 | 1 | \$125,000 |
| 8 | Irrigation System | LS | \$80,000.0 | 1 | \$80,000 |
| 9 | Native grass seeding & Mulch | AC | \$2,500.0 | 4.34 | \$10,850 |
| 10 | Pathway Lighting | LS | \$50,000.0 | 1 | \$50,000 |
| | | | | Subtotal | \$523,700 |
| | | | | 30% Contingency | \$157,110 |
| | | | | Estimated Total | \$680,810 |

POND ALTERNATIVE 4 - 6:1 SIDE SLOPES
 TOP OF POND = 5057.00
 WSEL = 5055.00
 BOTTOM OF POND = 5051.00
 VOLUME = 7.30 AC.FT.

5 Summary and Recommendations

All ponds were analyzed as retention ponds since currently there is no immediate plan for addition of any outlet from the pond. When the South Bernalillo detention facility is in operation, the outlet from this pond can be connected into that system and function as a detention pond and be a permanent solution for the area. A pump is needed to allow discharge from the pond since the outlet is located downstream of the tying point into the future storm system.

Pond bottoms are graded towards the northwest corner of the pond to discourage shallow water Ponding. Installing underground infiltration galleries in the same area will drain the 1 year storm volume. In the interim conditions dry wells are a good solution to drain the collected runoff. A more detailed study is needed prior to design of dry wells.

One short term Alternative would be placement of roadside ditches to convey runoff to a certain point and then connecting it to the underground storm system. This Alternative is possible for the upstream side of alignment 1 and 2 since the direction of sheet flow is towards the pond. Alignments 3 and 4 are located downstream of the pond and runoff needs to be conveyed through underground storm sewer. Runoff from east of either alignment can travel to a certain point before connecting to the underground storm system. Installing bar ditches require re-grading of all private driveways and installation of driveway culverts. Bar ditches also require regular maintenance. It is assumed that with placement of bar ditches no pavement removal is required. See Table 11, conceptual cost estimate of Combination of Curbed Section and Bar Ditches Section Roadway.

Existing paved streets in some areas are higher than the adjacent residential properties which create local roadside Ponding. To eliminate this problem, topographic mapping of the site and a detailed study of the area is needed to ensure all runoff is directed into the streets. Positive grades need to be provided to convey runoff in the right flow path. To collect all generated runoff, placement of curb and gutter and lowering of street grades would be the best permanent solution. See Table 12, conceptual cost estimate of Curbed Section Roadway.

Table 13 provides an analysis for positive and negative features of each retention pond alternative along with their estimated cost. To provide a usable park/play area for the community, the site will need to be designed with all the necessities and amenities and be maintained throughout the year. A conceptual cost estimate is listed on Tables 7 through 10 under each pond alternative.

TABLE 11: Conceptual Roadway Cost Estimate, Combination of Curb & Gutter and Bar Ditches

| Item | Description | Unit | Unit Cost | Quantity | Total |
|------|---|------|-------------|------------------------|------------------|
| 1 | Existing Asphalt Concrete Pavement up to 4 Inch Thick, Sawcut, Remove & Dispose , CIP | SY | \$6.0 | 7,350.0 | \$44,100 |
| 2 | Residential Asphalt Concrete Type A, 2-2 Inch Lifts, CIP | SY | \$5.0 | 8,800.0 | \$44,000 |

| Table 13: Retention Alternative Analysis Table | | | |
|--|---|--|-----------|
| Alternatives | Pros | Cons | Cost |
| Pond Alternative 1- Pond area covers the whole lot, 6:1 side slope, total retention volume 12.40 ac-ft | Provides a large retention volume | Pond bottom will contain runoff during big storm event until complete absorption | \$691,990 |
| | Larger or multiple areas can be allocated as play area | May not be usable if retaining runoff | |
| | Can retain the 100-year storm runoff | | |
| | One level park provides bigger usage area for the neighborhood | | |
| Pond Alternative 2- Pond area covers the whole lot, 10:1 side slope, total retention volume 10.59 ac-ft | Provides a large retention volume | Pond bottom will contain runoff during big storm event | \$676,078 |
| | Larger or multiple areas can be allocated as play area | May not be usable if retaining runoff | |
| | Shallower side slopes | Less retention volume as compared to Alternative 1 | |
| | Can retain the 100-year storm runoff | | |
| Pond Alternative 3- Multi level pond, 6:1 side slopes, total retention volume 9.71 ac-ft | Upper level of pond can remain dry and be usable while the lower level retains runoff | | \$656,890 |
| | Lower level can retain storm events up to the 10-year storm | Overall volume can retain the 100-year storm runoff | |
| Pond Alternative 4- Multi level pond, 6:1 side slopes, total retention volume 5.47 ac-ft | An area is excluded from the retention to remain dry and be usable at all times | Retention volume is reduced to provide more usable space | \$680,810 |
| | Lower level can retain storm events up to the 2-year storm | Overall volume can retain the 10-year storm runoff | |
| | Shallow pond | | |
